# 1 Introduction

## 1.1 Purpose

This document explains the requirements for a simple ATM Simulation System. It is designed for a student project to mimic basic ATM functions like withdrawing money, checking balance, and changing PIN. It helps developers and testers understand what the system should do.

## 1.2 Scope

The ATM Simulation System is a simple software program that lets users pretend to use an ATM. It includes features like logging in, withdrawing money, depositing money, checking account balance, and changing PIN. The system uses a fake database to store user and account details. It is meant for learning purposes and does not connect to real banks.

## 1.3 Definitions

- **ATM:** Automated Teller Machine (a pretend version for this project).
- **PIN:** Personal Identification Number (a 4-digit code to log in).
- **GUI:** Graphical User Interface (the screen users interact with).
- **SRS:** Software Requirements Specification (this document).
- **UML:** Unified Modeling Language (used for diagrams to show system interactions).

## 1.4 Overview

Section 1 explains the purpose and scope. Section 2 describes the system and its features. Section 3 lists the interface requirements. Section 4 details the main features. Section 5 covers other requirements. Section 6 includes a UML diagram.

# 2 Overall Description

## 2.1 Product Perspective

The ATM Simulation System is a standalone software program with a simple user interface that looks like an ATM screen. It uses a fake database to store user details like account number, PIN, and balance.

## 2.2 Product Functions

The system supports these main functions:

- **Login:** Users enter their account number and PIN to access the system.
- **Cash Withdrawal:** Users can withdraw a fixed amount of money (e.g., \$20, \$50).
- **Deposit:** Users can add money to their account.
- **Balance Inquiry:** Users can check their account balance.
- **PIN Change:** Users can update their PIN.
- **Logout:** Users can exit the system safely.

### 2.3 User Characteristics

- **Users:** Students or beginners who act as bank customers, using the system to learn how an ATM works.
- **Admin:** A teacher or developer who can reset the system or add fake user data.

### 2.4 Constraints

- Only one user can use the system at a time.
- Users get three tries to enter the correct PIN before the system locks them out.
- Minimum withdrawal: \$10; maximum withdrawal: \$500 per transaction.
- Maximum deposit: \$1000 per transaction.

### 2.5 Assumptions

- The system uses a simple fake database (e.g., a text file or list) to store data.
- All users have a valid account number and PIN in the fake database.

## 3 External Interface Requirements

### 3.1 User Interfaces

- **Screen:** A simple window (GUI) showing options like "Withdraw," "Deposit," "Check Balance," and "Change PIN."
- **Input:** Users type their account number, PIN, and amounts using a keyboard or buttons on the screen.
- **Output:** The screen shows messages like "Login Successful," "Balance: \$100," or "Error: Wrong PIN."

## 3.2 Software Interfaces

- **Database:** A simple file or in-memory list to store account numbers, PINs, and balances.
- **Program:** The system is built using a simple programming language like Python, Java, or C++.

# 4 System Features

## 4.1 User Login

- **Description:** Users enter their account number and PIN to log in.
- **Priority:** High
- **Input:** Account number (e.g., 123456), 4-digit PIN (e.g., 1234).
- **Process:** Checks if the account number and PIN match the fake database. Locks account after three wrong PIN attempts.
- **Output:** "Login Successful" or "Wrong PIN" message.

## 4.2 Cash Withdrawal

- **Description:** Users withdraw money from their account.
- **Priority:** High
- **Input:** Amount to withdraw (e.g., \$20, \$50).
- **Process:** Checks if the account has enough money. Updates balance in the fake database.
- **Output:** "Withdrawal Successful, New Balance: \$X" or "Insufficient Funds" message.

## 4.3 Deposit

- **Description:** Users add money to their account.
- **Priority:** Medium
- **Input:** Amount to deposit (e.g., \$100).
- **Process:** Adds the amount to the account balance in the fake database.
- **Output:** "Deposit Successful, New Balance: \$X" message.

#### **4.4 Balance Inquiry**

- **Description:** Users check their account balance.
- **Priority:** Medium
- **Input:** None (after login).
- **Process:** Retrieves balance from the fake database.
- **Output:** "Your Balance: \$X" message.

#### **4.5 PIN Change**

- **Description:** Users change their PIN.
- **Priority:** Medium
- **Input:** Old PIN, new PIN, confirm new PIN.
- **Process:** Verifies old PIN and updates to new PIN in the fake database if the new PIN matches the confirmation.
- **Output:** "PIN Changed Successfully" or "Error: PIN Mismatch" message.

### **5 Other Requirements**

#### **5.1 Performance**

- The system responds to user actions (e.g., login, withdraw) within 2 seconds.
- It handles one user at a time.

#### **5.2 Security**

- PINs are stored securely in the fake database (e.g., not shown in plain text).
- The system logs out users after 1 minute of no activity.

#### **5.3 Usability**

- The interface is simple with clear buttons and messages.
- Error messages are easy to understand (e.g., "Wrong PIN, try again").

#### **5.4 Documentation**

- A short user guide explains how to use the system.

- A developer guide explains how to set up the fake database and run the program.

## 6 UML Diagram

### 6.1 Use Case Diagram

The following UML Use Case Diagram shows how users (Customer and Admin) interact with the ATM Simulation System. It includes the main functions described in Section 4.

```
graph TD
    A[Customer] -->|Login| B[ATM Simulation System]
    A -->|Cash Withdrawal| B
    A -->|Deposit| B
    A -->|Balance Inquiry| B
    A -->|PIN Change| B
    A -->|Logout| B
    C[Admin] -->|Manage Database| B
    C -->|Reset System| B
```

#### **Explanation:**

- **Actors:**
  - **Customer:** Uses the ATM to perform transactions like login, withdraw, deposit, check balance, change PIN, and logout.
  - **Admin:** Manages the fake database (e.g., adds user data) and resets the system.
- **Use Cases:** Represent the system's main functions (Login, Cash Withdrawal, Deposit, Balance Inquiry, PIN Change, Logout, Manage Database, Reset System).
- **Relationships:** Arrows show which actor interacts with each function.

## 7 Appendix: Glossary

- **ATM:** A pretend machine for banking tasks.
- **Fake Database:** A simple file or list storing user account details.
- **PIN:** A 4-digit code to log in.
- **UML:** A way to draw diagrams to show how the system works.
